RKA Board of Director Elections

The Rhino Keeper Association has been created and guided by a group of very dedicated individuals, our Board of Directors (BOD). This year the RKA will be holding its first elections for members of the BOD. The RKA Elections Committee is currently establishing voting procedures for this important event and will keep RKA members apprised of significant developments.

The Elections Committee is accepting nominations for the BOD until April 15, 2007. Final nominees will be announced the week of May 7th at the Australia RKA workshop. The election will take place in June and the results be announced August 1, 2007. The BOD positions will begin on September 1, 2007 and last three years.

This year the three positions to be voted on are currently filled by Randy Pairan, Lance Aubrey and Becky Grieser. All are available to be elected for an additional term, however Becky has chosen not to seek re-election. Thank you Becky for all of your hard work!

Nominations can be made in accordance with the bylaws, Article VI Section 5:

- Any professional member in good standing may submit nominations for another professional member in good standing.
- Nominations received must be accompanied by the written endorsement of at least one professional member in good standing, who must not work at the same institution as that of the nominee.
- No more than two members of the Board may be from the same institution.
- Professional members must be willing to abide by the bylaws, meet the criteria in Article VIII, and support the code of ethics governing the organization.
- Nominees must be willing to share their knowledge and expertise to benefit the organization while participating in annual BOD meetings.
- BOD will be dedicated to ensuring the RKA is progressing toward the associations goals, and be accountable to the membership. As an organization, we need all BOD input to improve the future for all species of rhinoceros as well as directly address conservation, education and captive management issues.

When making nominations please include your name and contact information along with that of your nominee's. Nominees will be informed of their nomination, and asked to provide a brief biography prior to the elections that will be included in the election information.

Please send names of willing nominees by April 15, 2007 to the Election Committee Chairperson:

Dorothy Forman
Clarra13@juno.com

RKA was created to benefit rhinos and rhino keepers worldwide. The nominations and elections process is an opportunity for all members to become involved in YOUR organization! Please take this opportunity to become involved.

Facility Focus - Columbus Zoo

By: Adam Felts

The Columbus Zoo houses 2.1 Eastern Black Rhinos, Kijito (born at Brookfield Zoo in 1993), Kulinda (born at The Cincinnati Zoo in 1988) and their calf Klyde (Born here at the Columbus Zoo in 2002). Klyde is named after the Columbus Zoo's first black rhino Clyde, who holds the record for longevity for black rhinos in captivity, 49 years.

In 1999 the "Pachyderm" building at the Columbus Zoo was renovated to hold black rhinos and Asian Elephants. Prior to our renovation we held both white and black rhinos. Eventually, several years from now, our black rhinos will move into the new African Savannah area of the zoo and we will again renovate the existing rhino space to hold either Greater One Horned Rhinos or devote the space to hold more elephants.

OUTDOOR ENCLOSURES

With the existing rhino area there are two yards for the rhinos, with the larger yard being about 3/4 of an acre, while the smaller yard is connected to a rather spacious 2200 sq ft indoor viewing area. The substrate of both yards is a mixture of sand and topsoil. In these yards there are also strategically placed barriers, which are important for visual and physical barriers during introductions, and when keeping a pair of rhinos together for long periods of time. Since mud is such a critical aspect in skin care there are also concrete mud wallows in each yard, making it easier for cleaning and maintaining the all important mud wallows. To allow us to hang enrichment items in the large yard we have modified one of our tree holders with an aluminum rod that we can adjust up and down to hang items from.

Large Yard

Small Yard

INDOOR ENCLOSURES

During our renovation in 1999 we also constructed a spacious 2200 square foot indoor viewing room which is wonderful for the public to view the rhinos not only in the summer, but in the winter months as well. There are sky lights in this area, allowing the sun to brighten up the room, as well as a shallow pool that we fill with water in the summer (using a programmable shower), and mud in the winter. Along with the shower and pool there is a pulley system which allows us to hang enrichment items more easily and in a safer manner.

Our off exhibit holding areas consists of 3 stalls varying in size connected to one another and one modified elephant stall to accommodate Klyde during the winter. Both of these areas are also equipped with programmable showers, and a pulley system to hang enrichment items.

Klyde taking a shower

DIET

The rhinos' primary diet is ADF-16, along with a 50/50 alfalfa/timothy mixture of hay. Each rhino is fed twice a day, once in the morning and then in later afternoon, and we will give browse when available. We also give each rhino 2 ounces of SUPER Phosphorus supplement, and 6cc of a liquid Vitamin E Supplement, Emcelle Tocopherol.

TRAINING

All of the rhinos at the Columbus Zoo are target trained, which has allowed us to perform many medical procedures, including weekly blood draws, X-rays and an endoscope procedure. We decided when we began our training program to use the verbal bridge "good" when working with Klyde and Kulinda and a clicker for the bridge with Kijito. This decision was based upon their personalities and our preferences. For the target it is a simple nerf ball on the end of a stick, and the reward we use is a mixture of produce (apples and/or carrots). The behaviors that we have trained are simple husbandry behaviors for inspecting their condition, and other behaviors for specific issues such as the blood draws and the endoscope procedure. Kulinda was trained for the endoscope procedure because she was developing a bloody nose on a pretty consistent basis a couple of winters ago and we were attempting to determine the cause. Once her training was complete we were able to insert the endoscope into her nose, past her epiglottis and into her lungs (77cm total) with no anesthesia. Although we never did determine the cause we still consider it a training success.

Target

Open

Over

X-Ray

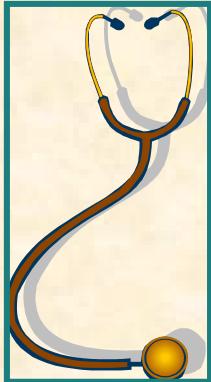

We prefer to use the front leg vein for blood draws, and draw blood weekly from each rhino. The rhinos have been trained to place the foot closest to the trainer, on a block, allowing access to the vein on the opposite leg. This behavior does two things. It keeps the animal's weight on the leg we are drawing from while also giving us better access to the vein.

Foot

Blood Draw

ENRICHMENT

Along with a training program each rhino also has a monthly enrichment schedule which increases the variability of the enrichment, while decreasing the frequency of the enrichment items. The enrichment items that seem to be the favorites are the tactile toys such as the bamboo chimes, and street brushes.

| Month | February | | | |
|-------|---------------------|-------|---------------------|----------------------|
| | Kijito | | Kulinda | Klyde |
| Date | Enrichment | Day | Enrichment | Enrichment |
| 1 | PVC pipe | Tues | waterbath | spool w/pb |
| 2 | water bath | Weds | boomer ball | hanging barrel |
| 3 | boomer ball | Thurs | PVC pipe | moose stool |

SPECIAL ACCOMPLISHMENTS

Over the years the Columbus Zoo has taken pride in our involvement in rhino conservation and rhino care. It takes dedication and input from everyone to accomplish the things we have accomplished. One of those accomplishments was apparent with the success of having the oldest black rhino in captivity. Clyde was 49 when he died, but the ideas and knowledge the rhino community gained from Clyde's life was immeasurable. Whether it was simply learning that we need to chop his food up allowing him to eat easier, or the king size mattress he used to help the pressure sores he developed in his later years, it was all to learn more about how to care for all rhinos in captivity. He was also the first rhino trained for semen collections.

The Columbus Zoo and Aquarium also took the lead with protecting the Northern White Rhinos Garamba National Park, via IRF. These efforts took the population from around 15 in 1993 to 32 in 1996. Columbus's support began in 1993, when we helped fund a vehicle that was to be utilized by the park guards while on patrol. Shortly afterwards we began supporting the guards, who were risking their lives to protect the rhino population, by giving a monthly bonus at a time when the government was unable to pay their salaries. The following years were filled with constant political turmoil, yet the rhinos managed to survive until 2005 when the forces involved with the genocide in the Darfur region of the Sudan began poaching rhinos and elephants in Garamba National Park, depleting the population to less than 5 today. At that point the guards were unable to stand up to the sophisticated techniques and superior weaponry of these poachers. Despite the ultimately unfortunate turn of events in Garamba, the Columbus Zoo has continued to be a powerful partner in rhino conservation through our continuing involvement with IRF.

To end on a happier note, the Columbus Zoo has had recent success in breeding black rhinos, with two calves born in the last seven years and a third one (hopefully) on the way!

Training and Enrichment

Bwana Chai Finds His Inner Picasso!

By: Tracy Herman and Sara Wunder
Busch Gardens, Tampa Bay

The Rhino Team has been training a new behavior to Bawan Chai, a 12 year old bull black rhino, *Diceros bicornis michaeli*, who has been in our collection a little over 7 years. The keepers thought painting would be a great way to develop a stronger relationship with Chai. In addition, it is a way to enrich him and teach him patience, something a bull rhino generally lacks.

Tracy Herman, an Animal Care Specialist, became the primary trainer for painting with Chai. She worked with him a minimum of twice a day to establish this new behavior.

Before the actual process of painting could begin, Chai had to be desensitized to the canvas and the feel of the paint brush, without paint, on his prehensile upper lip. Once Chai was comfortable with this, he was trained to touch the canvas and allow paint to be applied to his lip. The following are the detailed steps taken to train Chai to paint:

- The first step was to call Chai by using the pre-existing behavior “target.” The criteria for targeting the black rhino is to touch the trainers hand with lip, while the upper lip is presented down.
- Once he is under control, the SD “Brush” is used to apply paint to his upper lip, which is now pointing up. The paint is applied by putting paint on a thick brush, and then dabbing the paint on his upper lip. He is then bridged with “OK” and reinforced.
- Next, the SD “Paint” is used along with presenting of the canvas and Chai touches the canvas with his lip. Again, Chai is bridged with “OK” and reinforced.
- In a short time and with heavy reinforcement, Chai did not simply touch the canvas with his painted lip, but began to move his lip around the canvas on his own.

Editor's Corner

Greetings from Denver!

When we see the first robin, hope springs eternal that we will finally be released from the grips of a very cold and snowy winter in the Rocky Mountains! It is my goal to provide a quality newsletter with information that will help each one of us to improve the quality of the care we provide to our beloved rhinos. With that said, I would like to extend an invitation to all of our membership in helping provide articles, pictures, enrichment ideas, and research projects for the CRASH. Also, Dave Clawson has put an amazing amount of work into our awesome website, and could use help in finishing sections where information is still needed. (dclawson@thewilds.org)

Thank you all for your continued support of this fledgling organization!

Best Wishes,

Christine Bobko (rhinoqueen@yahoo.com)

Painting did not come without its fair share of obstacles that had to be worked through. In the beginning Chai did not like the feel of the paint on his lip and would rub it off on the ground. Tracy took a step back and added water to dilute the paint so it was less noticeable, adding less water each day until it was no longer necessary.

Another hurdle was encountered after applying the paint to Chai's lip and reinforcing him with food. He was unintentionally licking all the paint off when eating. The reinforcement had to be changed from food to tactile or verbal, only giving him food reinforcement after he had physically painted.

Lastly, Tracy learned that placing the canvas outside the ballards and not against a flat surface would alleviate the chance of him putting his horn through the canvas! Despite the obstacles, Chai learned to paint in only 2 months!

In the future, painting will be expanded to the other rhino keepers. They will begin working with Chai on painting and then progress to the two adult female black rhinos. Ultimately, they would like guests to “participate” in painting sessions on the Animal Adventure Tours. After their tour, the painting will be available for purchase.

Original paintings by Chai will be available for purchase at Bowling for Rhinos, Tampa Bay American Association for Zookeepers (AAZK) fundraising functions, and in the gift shops soon. Proceeds from Bwana Chai's paintings will benefit the Anheuser-Busch Conservation Fund.
